Andrew,

Thanks for discussing this permit with me last week. Sorry it has taken a bit for me to get back to you. As we discussed, we would like to modify our discharge permit based on the following:

- We are permitted to receive 7,500 barrels of produced water a day; the air permit is based on discharge and is currently being modified to accommodate this number.
- We would like for our discharge permit to be based on a worst-case scenario where we process 100% of the water we receive, and a best case scenario where we are able to achieve 85% permeate through our reverse osmosis system. Therefore, we are requesting to discharge 6,375 barrels (267,750 gallons) per day.
- Due to the higher volume, discharge will be semi-continuous rather than intermittent.
- We understand that this higher discharge volume will affect the requirements for discharge water quality.

Please let me know if you have any questions or would like any further clarification.

Regards,

Randy,

I will be taking care of this permit.

Prior to doing any modification I needed to amend the general permit itself, to get it up to date with permitting requirements. The GP is off of public notice, will be issued today and will be effective March 1. During the month of February I intend on getting all certifications under this GP updated, issued and effective along with the effective date of the GP.

The cert should be updated, and effective, by March 1.

Andrew,

I am contacting you with regard to Permit Number COC0002 for the GreenBack Produced Water Recovery facility near Rifle Colorado. In November, Joby Adams with CGRS submitted a request for modification to the permit. I am taking over Joby's role and wanted to introduce myself to whomever is working on the modification. I was also wondering about the timing on the modification and had some general questions about it too.

Could you let me know who has been assigned to this? The original permit was reviewed by Gary Beers, and I understand he is no longer with CDPHE.

Thanks!
