Erin -

The proposed flow volume for each of the above referenced permit applications is 10,000 bwpd or 0.42 MGD. As indicated in the permit, volume may be less when excess produced water can be recycled and used for completions operations. There will be no other wastewater or stormwater that will contribute to the discharge volume prior to entering the stream channel.

Please feel free to contact me if there is any additional information you need to process the applications.

Thank-you.
Peggy
